Why Cirprotec?

CIRPROTEC, SPECIALISTS IN LIGHTNING AND OVERVOLTAGE PROTECTION

Pioneers in the **design and manufacture of lightning and overvoltage protection devices**, Cirprotec has been manufacturing high quality solutions and products for over 20 years using the most innovative technologies.

This range is completed with consultancy services based on our experience and knowledge; proximity and commitment to achieve success in every project.

SAFETY & RELIABILITY FOR SURGE PROTECTION

- **Bringing together the experience** of the principal international **manufacturing and test standards** for SPDs (IEC and UL)
- **Innovative ranges combining surge protection and ground monitoring** to provide full safety and continuity of service. SAFEGROUND®.
- **World-class surge test platform**, with laboratories holding accreditations for both IEC/EN 61643-11, UL 1449 4th edition, EN 50550 and UNE 21186.
- **A high degree of internationalisation**, with an extensive network of sales offices and a presence in over 60 countries.
- **Leadership in POP** (Power-frequency Overvoltage Protection) and combined devices **SPD+POP**. EN 50550.
- Wide range of solutions targeting **industrial, commercial and residential applications**.

COMPREHENSIVE PROTECTION

An effective overvoltage protection must **combine the following protection systems**:

- **External protection** (ESE lightning rods and faradization). System for protection against direct lightning strike. These capture the lightning within the protected area and lead it, in a controlled manner, safely to ground.
- **Internal protection** (power frequency overvoltage and surge protection devices). Equipment designed to protect against the effects of overvoltages in equipment connected to the power supply systems and/or communications networks.
- **Grounding systems** (grounding and insulation monitoring). Systems that allow atmospheric discharge currents to be dispersed into the ground. The need for monitoring the grounding system.

Cirprotec offers a **wide range of products** for each of these systems. It also develops custom products, provides advice and consulting services and the best possible after-sales service.

1993 Cirprotec founded in Terrassa (Spain)	1994 Global innovation. First power frequency overvoltage protection device on the market.	1997 Range ESE nimbus® lightning rod	1999 Creation of the CPT Lab, the embryo of what is today one of the world's leading reference overvoltage laboratories .	2004 Patent V-CHECK, the first combined protection device against power frequency overvoltages and surges .	2005 Driving EN 50550 POP standard, as a member of the working committees.

Your partner in surge protection

WORLD-CLASS SURGE TEST PLATFORM

Cirprotec is committed to **innovation**. More than 30.000 tests in 20 years are the proof of that quest for continual improvement.

In the field of lightning and surge protection Cirprotec has a highly specialized team, test laboratories, high investment in R+D, international patents and presence on standards committees.

Cirprotec has **two state of the art overvoltage testing laboratories** for the development and test quality assurance of lightning and surge protection systems. The two are complementary, in terms of the available resources, to be able to offer the **widest possible range of tests to IEC, UL and NFC standards**.

CIRPROTEC GUARANTEES THE SAFETY OF ITS SYSTEMS

Cirprotec designs and manufactures all of its solutions according to the strictest quality procedures and certifies its products in accordance with the most demanding codes and standards (**IEC, EN, NF, NFC, etc.**) through independent certifying organisations such as **ENAC, UL, Dekra, etc.**

2006	2006	2010	2012	2014	2016
Patent G-CHECK®, continuous grounding system monitor.	Expansion of the CPT Lab to over 1.000 m ²	Consolidation of internationalisation (international certifications and approvals).	NS range for LED lighting solutions (partner of the leading outdoor lighting manufacturers).	Strategic agreement with Mersen to promote internationalisation.	SAFEGROUND® patent, a revolution in surge protection.

Risk of voltage surges

EXPOSURE TO OVERVOLTAGES: DAMAGE AND COSTS

Electrical and electronic equipment is indispensable in the daily activities of today's businesses and individuals. Such devices are connected to the electricity grid, often exchanging data and signals through communication lines and are usually sensitive to disturbances. These **interconnecting networks provide a propagation path for overvoltages**.

Protection against lightning and overvoltages not only ensures the **safety of people, goods and equipment**, but also ensures **continuity of installation services**.

Overvoltage protection **extends the life of the equipment by more than 20%**, which significantly reduces **the volume of electronic waste**. It also reduces the power consumption of the installations, all of **which translates into cost savings** and environmental sustainability.

NOT ALL PROTECTION DEVICES PROTECT. CHOOSING WELL IS YOUR RESPONSIBILITY

The various players in the chain of sale need to ensure that protection devices comply with the product standards, as this will result in **greater installation safety and reliability**.

It is important to check and demand the following information:

- Product CE marking and declaration
- Testing in accordance with national and international product codes and standards
- Product certifications
- Integrated quality and environmental management system
- Audited production

Surge protection

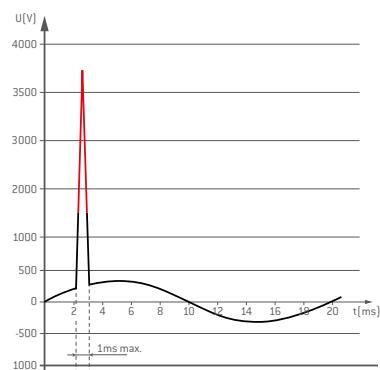

TRANSIENT VOLTAGE SURGES IN LV POWER LINES

Transient overvoltages are voltage surges that **can reach tens of kilovolts** with a duration of the order of **microseconds**.

Despite their short duration, the high energy content can cause serious problems to equipment connected to the line, from **premature aging to destruction, causing disruptions to service and financial loss.**

This type of surge can have various different causes, including **atmospheric lightning directly striking** the external protection (lightning rods) on a building or transmission line or the associated induction of **electromagnetic fields on metallic conductors**. Outdoor and longer lines are the most exposed to these fields, which often receive high levels of induction.

It is also common for **non-weather phenomena, such as transformer centre switching or the disconnection of motors or other inductive loads** to cause voltage spikes in adjacent lines.

When the peak voltage reaches a value higher than the equipment can withstand, it causes its destruction.

Power supply systems

Telecom and signalling networks

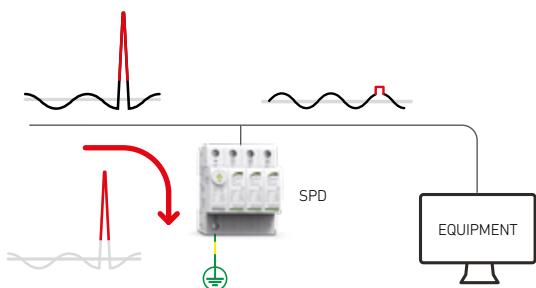

IMPORTANCE OF THE GROUND CONNECTION

Overvoltage protectors (SPD) **divert excess energy to ground**, so limiting the peak voltage to an acceptable value for connected electrical equipment.

A **ground connection in adequate condition** is, therefore, a key aspect for effective protection against overvoltages.

Monitoring ground connection condition guarantees proper operation of surge protection devices.

Operating principle of an SPD

SURGES IN TELECOM AND SIGNALLING NETWORKS

Surges tend to induce currents in all metal conductors; **not only are the power lines affected**, but so are all cables to a greater or lesser extent, depending on the distance to the focus of the surge.

Although a lower current is induced, the effect produced is **equally or more destructive**, due to the **greater sensitivity of electronic equipment connected to communications lines** (telephone, Ethernet, RF, etc.).

RISK ASSESSMENT

There are around **5000 storms around the world at any time, with an average lightning current of 20-30 kA**.

The level of risk to a facility due to the effects of lightning depends on the **density of lightning strikes**. Isokeraunic maps show their geographical distribution based on historical strike data. Design of the protection then needs to be consistent with the facility location and the associated risk (see page 8).

Surge protection

Parameters and selection of an SPD according to IEC 61643

PROTECTION PARAMETERS ACCORDING TO IEC 61643-11

I_{imp}

Impulse current

Peak current in 10/350 µs waveform which the protection device can withstand.

I_{max}

Maximum discharge current

Peak current in 8/20 µs waveform which the protection device can withstand.

I_n

Nominal current

Peak current in 8/20 µs waveform the protection device can withstand at least 20 times.

U_p

Voltage protection level

Maximum residual voltage between the terminals of the protection device during the application of a peak current equal to the nominal current (I_n).

U_c

Maximum continuous operating voltage

Maximum effective voltage that can be applied permanently to the terminals of the protection device.

U_{oc}

Open circuit voltage (combined voltage pulse)

This parameter is used only for the Class III test and is applicable to a Type 3 SPD. It consists of the injection of a combination wave (1.2/50 µs in open circuit - 8/20 µs in short circuit).

I_{fi}

Follow current extinction capability

This parameter is only devoted to surge protectors using "spark gap" technology. Once they have "switched", these surge protectors conduct part of the network current (follow current) and need to interrupt it.

SELECTION OF SPDs

When selecting an SPD, several points must be considered:

1- Network typology: TNS, TNC, TT, IT, PV
and No. of conductors (see page 10).

2- Nominal voltage rating (U_n) of the supply. Both features will condition **the maximum continuous operating voltage (U_c)**. IEC/HD standard 60364-5-534 sets the minimum allowed value of U_c depending on the system configuration, taking into account a safety margin of the device above the nominal voltage.

3- Voltage withstand rating (U_e) of the equipment in the installation. The protection device should be selected so that **the voltage protection level (U_p)** is compatible with the value of U_e (U_p<U_e). IEC/HD standard 60364-4-443 classifies equipment into four categories, based on the impulse voltage they are capable of withstanding. Items of electronic equipment to be protected are typically part of surge Category 1, withstanding up to 1.5 kV, which means they require a dedicated Type 3 or the very least a Type 2 protection device no more than 10 m away.

4- Exposure of the installation to atmospheric and non-weather phenomena.

The actual exposure of an installation depends on the combination of 3 basic criteria: ① **electrical service system**, ② **external (and internal) switching of loads** and ③ **lightning strike density** (isokeraunic level).

Factors ① and ② generate three possible situations:

Direct impact exposure of an installation fitted with external lightning protection system or close to a tower or element susceptible to receive a strike.

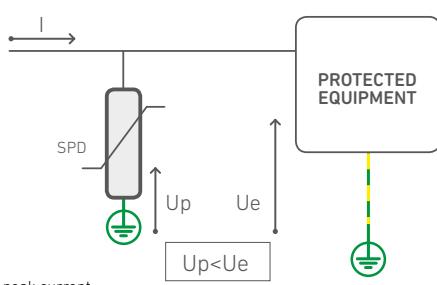

High exposure of an installation fed by long overhead service lines or situated in large industrial or commercial premises.

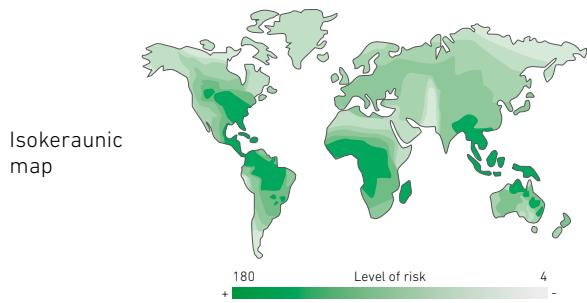

Medium exposure of installations with an underground service and not subject to switchings of industrial loads in the vicinity.

Factor ③ the **isokeraunic level** of a certain country.

Density of lightning strikes on the ground Ng (strikes/year · km²)

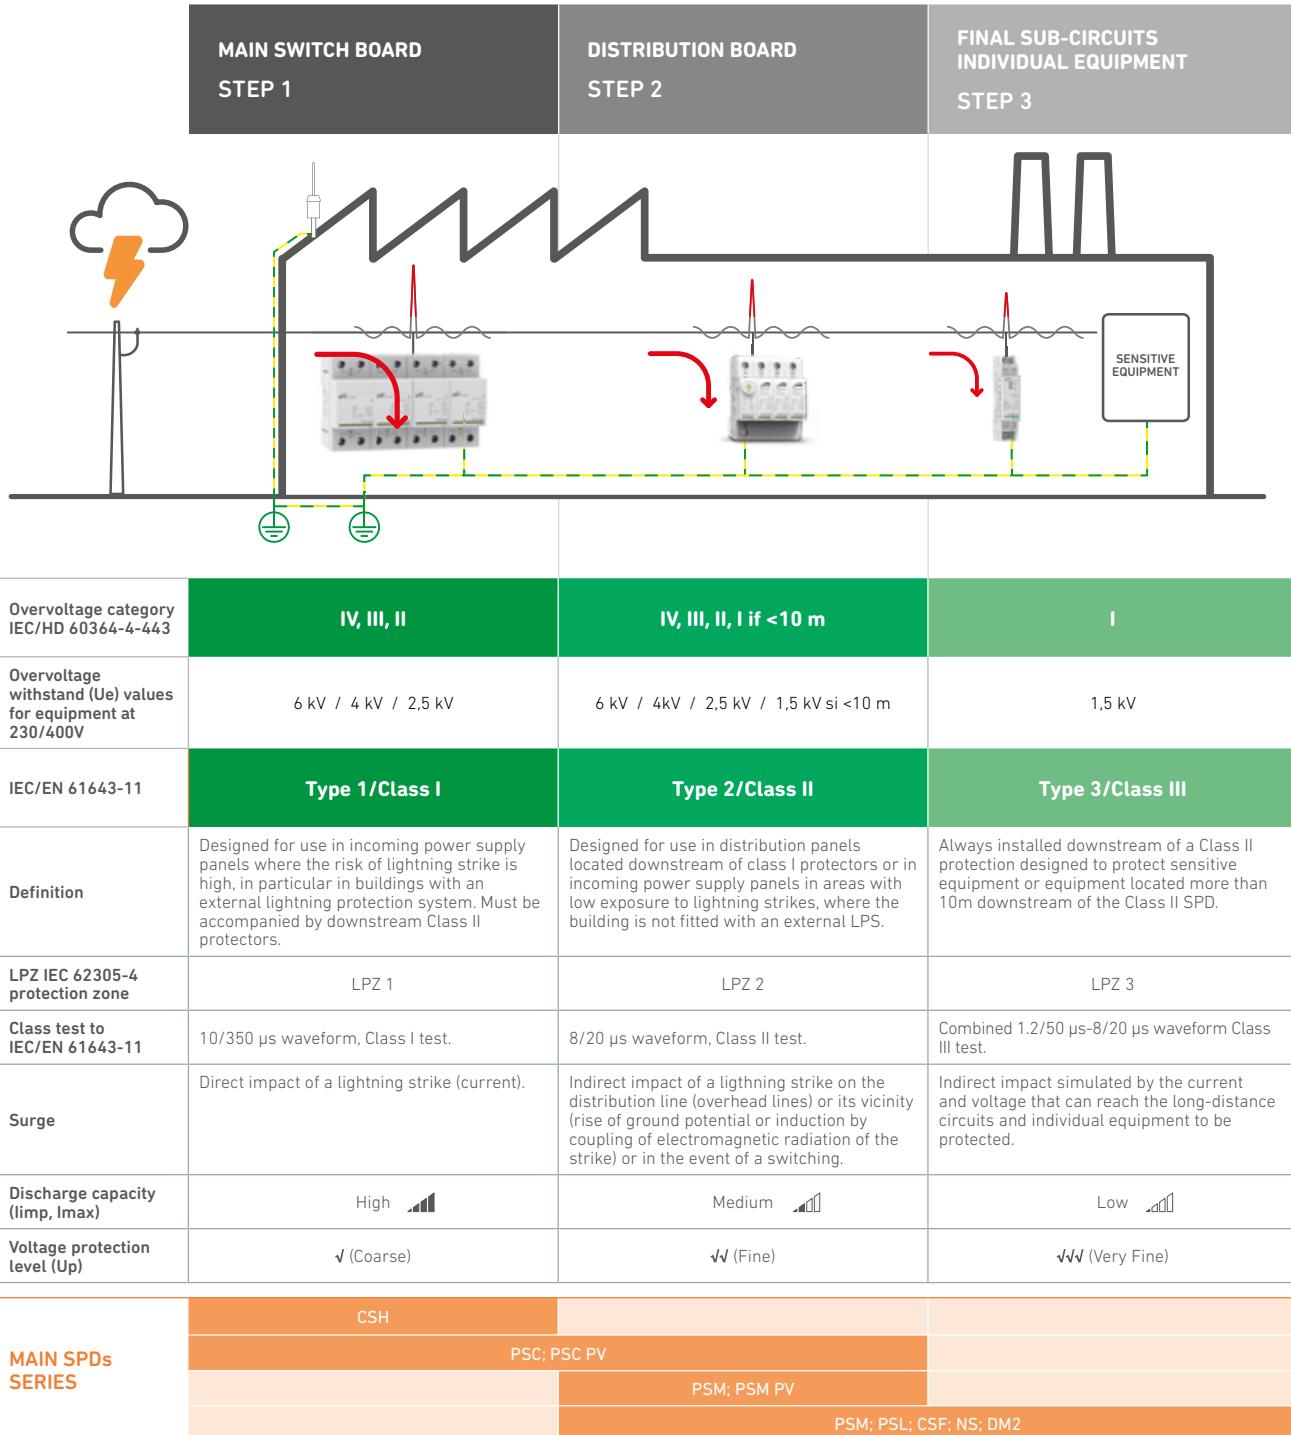

Protection system of coordinated stages: Type 1, 2 and 3 SPDs

The SPDs of a surge protection system must be able to withstand the discharged current and provide a U_{res} level (residual voltage) lower than the U_e peak voltage that the equipment can withstand.

Most of the times it is not possible to achieve this with just one SPD, especially because the intensity of the surge is not known, and because of the induction of overvoltages when conductors

exceed 10 m. The optimal system of protection is the **3-STEP approach**, in which successive stages are combined in the performance of high discharge capacity devices and devices with an optimal voltage protection level (low).

This is addressed by the definition of "Types" or "Classes" of SPDs according to the type of transient pulses to which each protected zone in the installation is subject to.

Grounding systems

All national codes on the generation, transmission and distribution of electricity require **grounding of all the elements of the installation**. This ground connection ensures a sufficiently low impedance path for protection devices to protect people and equipment,

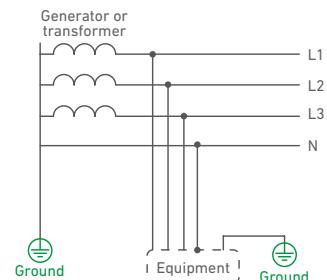

and to prevent hazardous step and touch voltages. As we will see, **there are several systems** for making this ground connection, depending on the interconnection between the installation components.

TT ARRANGEMENT

- Individual ground connection at the consumer level, separated from the transformer. Without distributed ground conductor (PE).
- The protective ground is the physical ground connection itself.

ADVANTAGES: Less interference. More reliable.

DISADVANTAGES: High impedance L-PE fault loop, hence it requires a differential protection device.

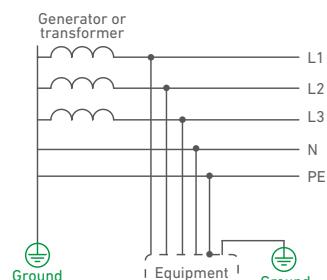

TN-S (OR TNC-S) ARRANGEMENT

- Neutral and ground wires distributed from the installation origin (one cable performs both functions in TNC-S distribution).
- The protective ground connection is through the protection conductor itself, generally to the transformer ground.

ADVANTAGES: Maximum safety against cable breaks and L-PE faults.

DISADVANTAGES: The most expensive system, both for cable and for installation and maintenance.

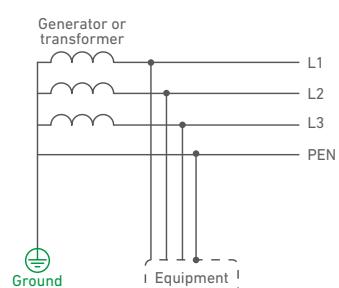

TN-C ARRANGEMENT

- The PEN conductor performs the functions of neutral and ground wire from transformer to the consumer.
- The protective ground connection is through the PEN conductor, generally to the transformer ground.

ADVANTAGES: Minimum costs for both wiring and installation.

DISADVANTAGES: Cable breaks are safety critical. High electromagnetic interference. Need for oversizing cable.

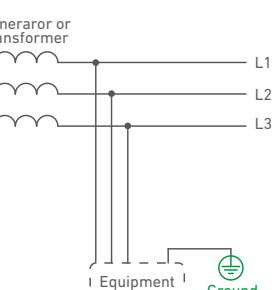

IT ARRANGEMENT

- The transformer neutral is isolated from ground. Optional distributed neutral conductor. Local ground connection at the consumer level.
- The protective ground is made via the local ground connection. There is no risk at the first L-PE fault due to the high loop impedance.

ADVANTAGES: No neutral breakage risk. Continuity of service in case of L-PE incidents.

DISADVANTAGES: Requires connected devices to be able to work at line voltages. Needs insulation monitoring to act at the first fault.

Power frequency overvoltage protection

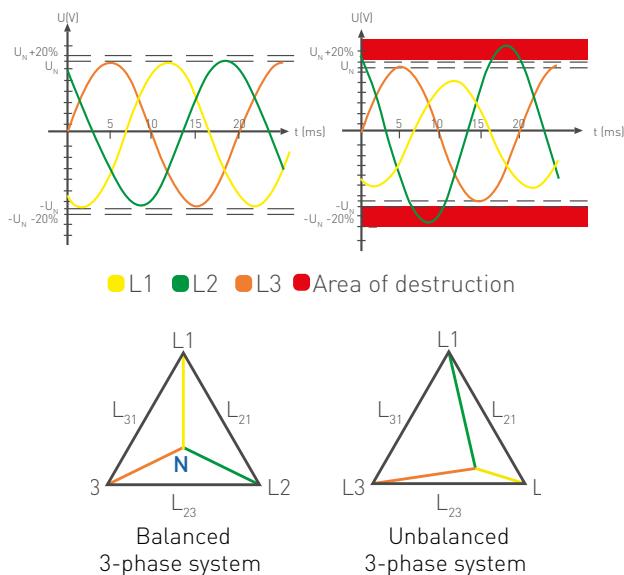

EN 50550 standard for POP

POWER FREQUENCY OVERVOLTAGE

Power frequency overvoltages are voltage increases of hundreds of volts, caused by phase imbalances and lasting for an indefinite period.

They are usually caused by breakage of the neutral, leading to a reduced service life in the affected equipment, or to their immediate destruction and even fires.

The use of these protectors is essential in areas where fluctuations occur in the mains voltage values.

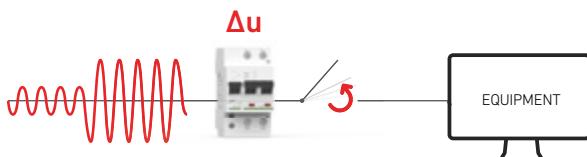

POP PROTECTOR

From the power supply point of view, the electricity grid is formed by a 3-phase system with balanced phases. A fourth conductor called **Neutral** is used for compensation or as a **common point** for devices connected to the supply network.

An accidental loss of the neutral conductor or compensator leads to a voltage drop in the phases with the highest load and an increase in voltage above that which can be withstood in the phase with the lowest load.

POP protection devices monitor each of the single voltages upstream. When they detect an **increase in voltage of 20% or more**, the **supply is interrupted** by a built-in circuit breaker device or by an external one.

Operating principle of a POP protection device

POP DEVICE STANDARD EN 50550

EN 50550 "Power frequency overvoltage protective devices for household and similar applications (POP)" published March 16, 2011, is the first **standard for power frequency overvoltage protection devices**.

Objective: **To regulate the design of equipment for power frequency overvoltage protection.**

Field of application: Overvoltage protection devices (POP) for household and similar applications.

THE PROTECTOR SHALL MEET

- **Progressive Voltage/Time tripping curve**. The tripping time depends on the magnitude of the overvoltage, ensuring quick tripping in the case of severe disturbances while avoiding unwanted activation in the event of small voltage increases.
- **Common manufacturer** of the power frequency overvoltage protector and the **circuit-breaker** component (MCB).
- **Impossibility of using earth leakage** or current differential as **operating principles**.

BENEFITS

- Ensures high standards of quality and reliability.
- Guarantees operation and power frequency overvoltage protection.
- Avoids untimely tripping.

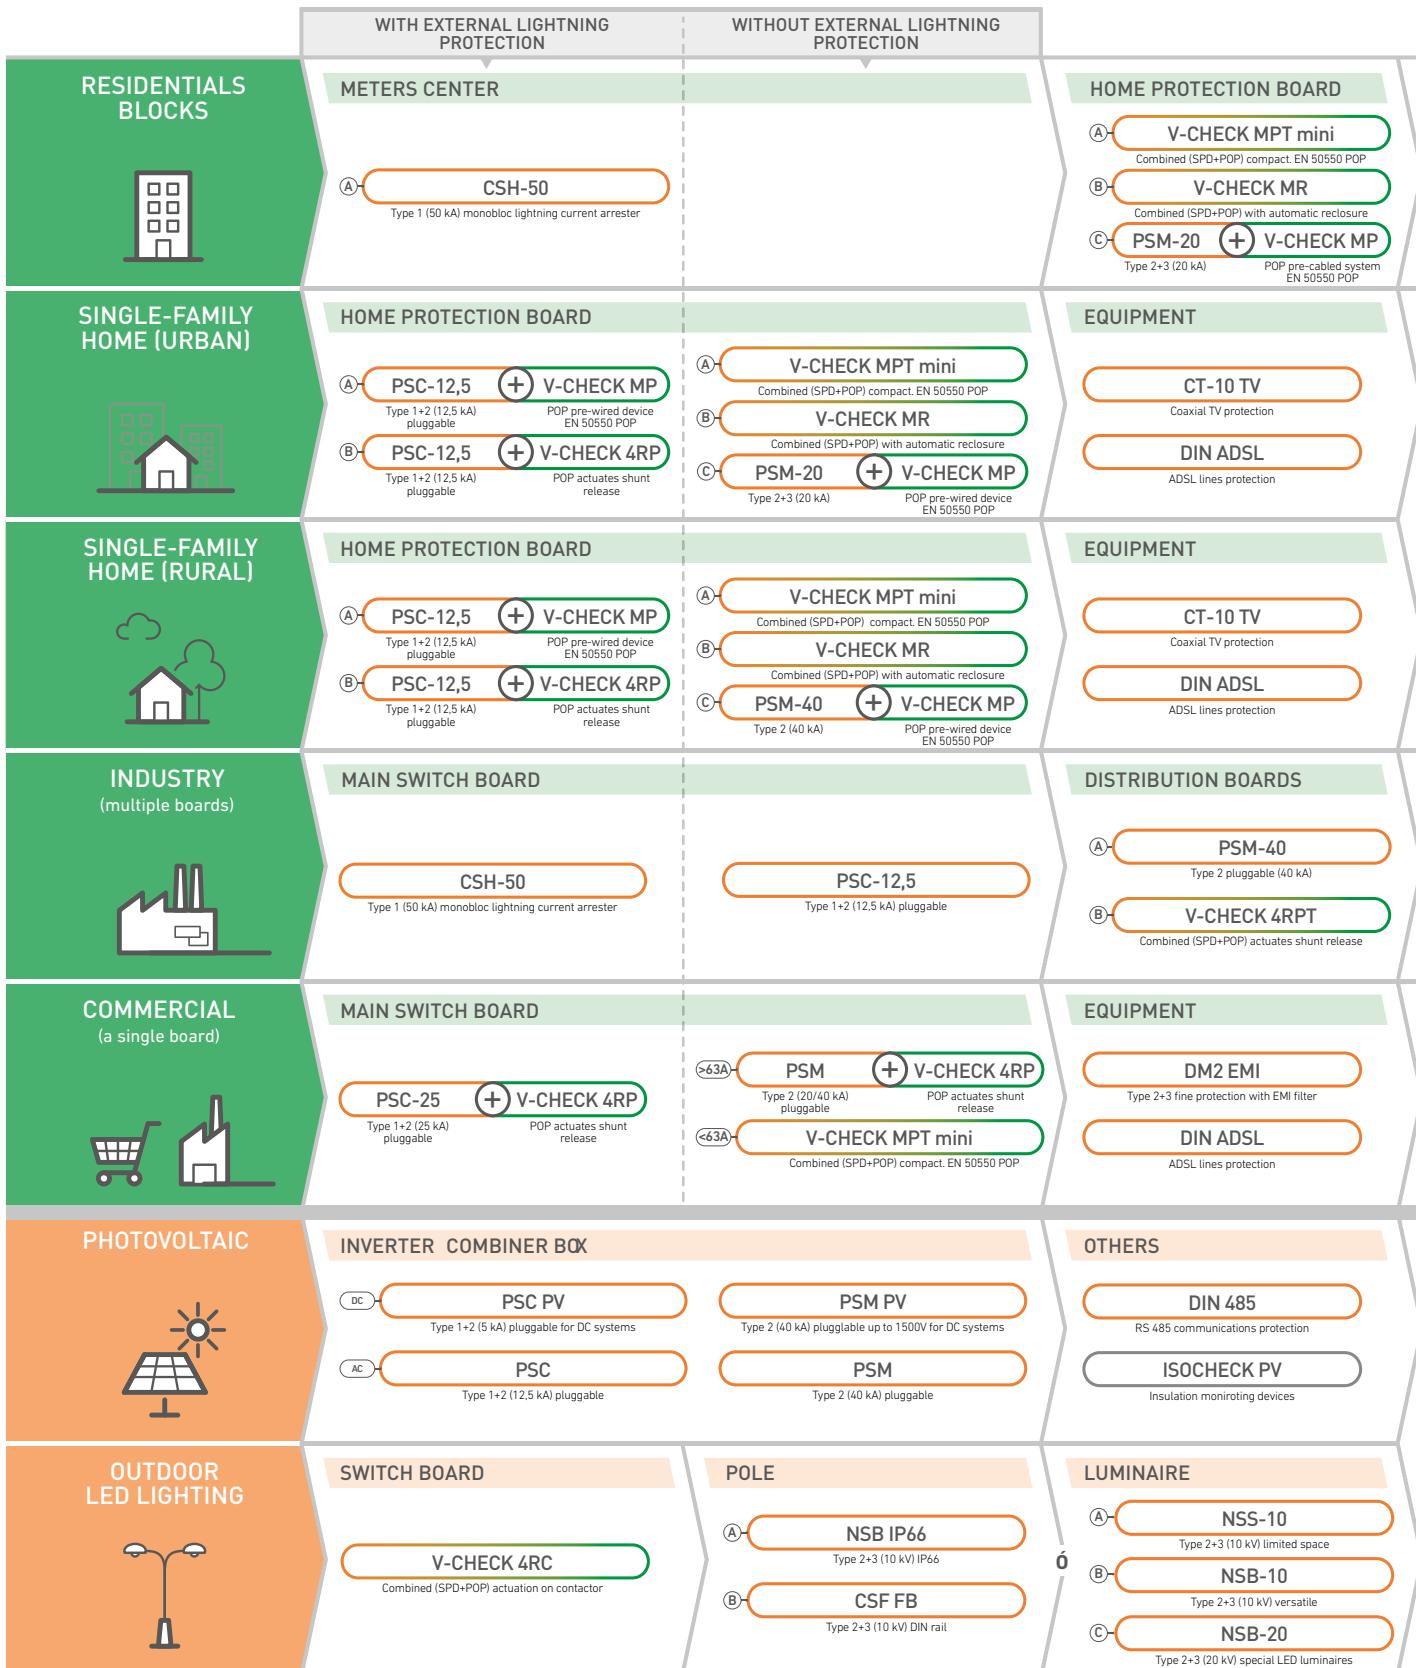

STANDARDS

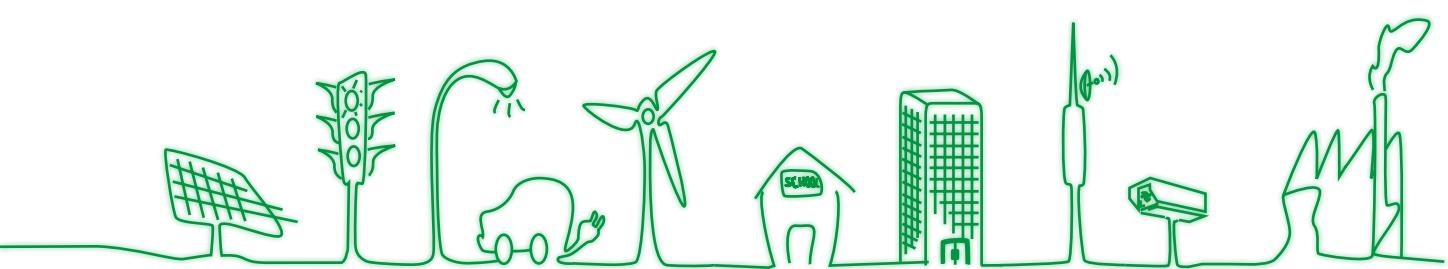

Before the publication of EN 50550, there was no standard covering power frequency overvoltage protection. The design of such protection devices is now standardised.

In Spain, in certain areas, the use of power frequency protection devices is obligatory, depending on particular electricity company technical standards. These reinforce compliance with Article 16.3 of the Spanish Low Voltage Electrical Regulations (REBT) 2002, stressing the obligation of installing overvoltage protection devices.

SOLUTIONS AND SERVICES. HOW CAN WE HELP YOU?

We have been working since 1993 to offer our customers value **solutions in lightning and overvoltage protection**, adapted to the specific needs of each customer and sector.

This **extensive experience**, combined with close collaboration with significant companies in the main industrial **sectors** (**photovoltaic, wind, telecoms, electric vehicles, water treatment, automation, etc.**) enable us to offer a wide range of product solutions, as well as **advice and/or consultancy services** from our sales engineers.

Furthermore, Cirprotec's R&D department and our network of laboratories are at your disposal for joint **development of specific product solutions** or official approval of protection equipment.

SLIM

Compact combined device
(Type 2+3) for fine protection.

Ideal for **confined spaces**.

COMPACT SOLUTION FOR LED LUMINAIRES

Suitable for all network configurations and voltages (including IT systems).
CB Scheme Certified to IEC, and also UL.

Solutions available for Class I and Class II luminaires.

HIGH PERFORMANCE PLUG-IN PLATFORM

- Multistandard products
- IEC 61643 and UL 1449.**
- Specific solutions for **photovoltaic** that comply with **EN 50539-11** and **UL 1449, up to 1500 Vdc**, type 2 and type 1+2.
- Solutions for 12 V, 24 V, 48 V, 60 V, 120 V, 230 V, 400 V, 690 V.

EMI / RFI FILTER

Available versions that include a **high performance electromagnetic filter** to attenuate network noise.

STAGED PROTECTION (T1, T1+2, T2, T2+3)

Cirprotec offers robust solutions for the **first stage of protection** against direct lightning strike (Type 1), protectors for a **second protection stage** (T2) and **fine protection** devices to locate near the equipment to be protected.

SAFEGROUND®

Monitoring the ground connection from within the actual overvoltage protection device.

- Confirmation of proper installation
- Efficient surge protection
- Safety information in the event of indirect contact

The **premium solution** for the most demanding installations.

CSH

CSH is the range of single pole Type 1/Class I lightning current arresters, able to shunt energy (current) from a direct lightning strike (10/350 µs) on an external lightning protection system (LPS) or overhead supplies, in accordance with the IEC/EN 61643-11 standard.

Suitable for the first step of protection at the service entrance (meters center or main switch board) and in areas of high atmospheric exposure where installations are usually provided with an external protection system against direct lightning strikes.

RATINGS AND FEATURES

- Lightning impulse current (10/350 µs): 50 kA
- Follow current quenching capacity (lfq): 50kA
- Leakage current free (LCF)
- Multidischarge technology
- Single pole devices for TNS, TNC, TT and IT systems.
- Un (L-N/L-L): 120/208 V, 230/400 V, 277/480 V, 400/690 V
- Monobloc DIN rail format

Type 1+2 SPDs

PSC 12,5

PSC 12,5 is the range of combined Type 1+2/Class I+II devices intended for discharging lightning currents (10/350 µs) and protecting against induced voltage surges (8/20 µs), in accordance with the IEC/EN 61643-11 standard.

Suitable for the first step of protection in the main switchboard and in areas of high atmospheric exposure, where installations are often provided with external protection against direct lightning strikes.

RATINGS AND FEATURES

- Lightning impulse current (10/350 µs): 12.5 kA per phase
- Maximum discharge current (8/20 µs): 65 kA per phase
- Nominal discharge current (8/20 µs): 20 kA per phase
- TNS, TNC, TT and IT networks
- Un (L-N/L-L): 60 V, 120/208 V, 230/400 V, 277/480 V and 400/690 V
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors

Type 1+2 SPDs

PSC 25

PSC 25 is the range of combined Type 1+2/Class I+II devices intended for discharging lightning currents (10/350 µs) and protecting against induced voltage surges (8/20 µs), in accordance with the IEC/EN 61643-11 standard.

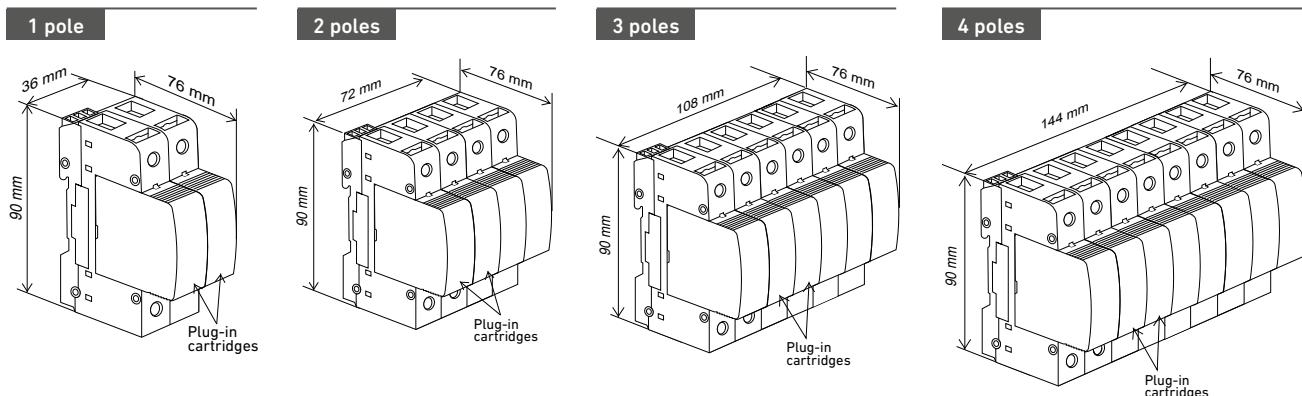

Suitable for the first step of protection in the main switchboard and in areas of high atmospheric exposure, where installations are often provided with external protection against direct lightning strikes.

RATINGS AND FEATURES

- Lightning impulse current (10/350 µs): 25 kA per phase
- Maximum discharge current (8/20 µs): 100 kA per phase
- Nominal discharge current (8/20 µs): 25 kA per phase
- TNS, TNC, TT and IT networks
- Un (L-N/L-L): 120/208 V, 230/400 V, 400/690 V
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors

Type 1+2 Photovoltaic SPD

PSC 5 PV

PSC 5 PV is the PHOTOVOLTAIC range of combined Type 1+2/ Class I+II devices intended for discharging lightning currents (10/350 µs) and protecting against induced voltage surges (8/20 µs), in accordance with EN 50539-11 and IEC 61643-31 standards.

Cirprotec uses its dynamic thermal disconnection system with high breaking capacity, optimised for DC voltages. This means there is no need to install a backup fuse to interrupt the typical short-circuit currents of any photovoltaic installation.

These lightning current and surge protection devices are suitable for all photovoltaic applications: large-scale, rooftop and self-consumption (off-grid) DC installations; especially in facilities provided with external LPS.

RATINGS AND FEATURES

- Lightning impulse current (10/350 µs): 5 kA
- Maximum discharge current (8/20 µs): 40 kA
- Nominal discharge current (8/20 µs): 20 kA
- Ucpv: 1060 Vdc
- Iscpv: 10 kA (EN 50539-11), no back-up fuse required
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors

Type 2 Photovoltaic SPD

PSM 40 PV

PSM 40 PV is the PHOTOVOLTAIC range of Type 2/Class II devices intended for protecting against induced voltage surges (8/20 µs), in accordance with EN 50539-11 and IEC 61643-31 standards.

Cirprotec uses its dynamic thermal disconnection system with high breaking capacity, optimised for DC voltages. This means there is no need to install a backup fuse to interrupt the typical short-circuit currents of any photovoltaic installation.

These surge protection devices are suitable for all photovoltaic applications: large-scale, rooftop and self-consumption (off-grid) DC installations.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 40 kA
- Nominal discharge current (8/20 µs): 20 kA
- Ucpv: 65, 80, 660, 1060 Vdc and 1500 Vdc
- Iscpv: 10 kA (EN 50539-11), no back-up fuse required
- SCCR: 50 kA, 100 kA (UL 1449 4th Ed)
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors

Type 2 SPDs

PSM 40

PSM 40 is the range of Type 2/Class II devices intended for protecting against induced voltage surges (8/20 µs), in accordance with the IEC/EN 61643-11 standard.

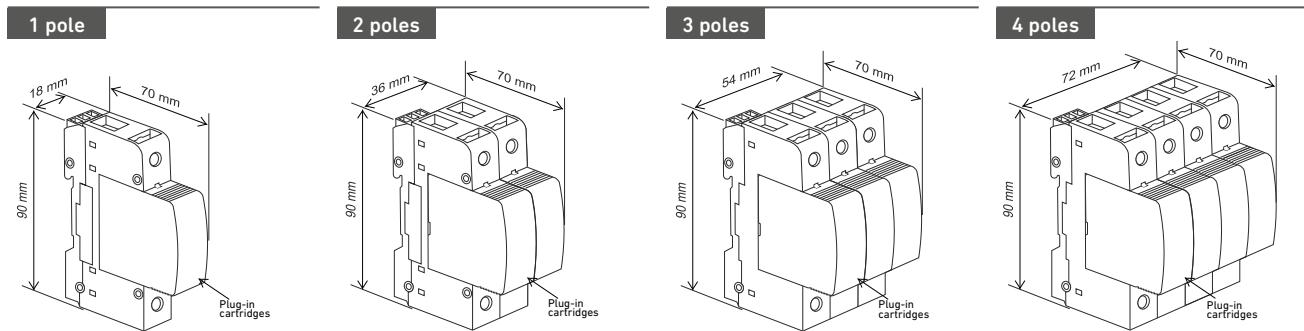

Suitable for the second step of protection in distribution boards in which Type 1 protectors are installed upstream or for the first step of protection in commercial installations, homes or other applications not exposed to direct strikes and with no external lightning protection system.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 40 kA per phase
- Nominal discharge current (8/20 µs): 20 kA per phase
- TNS, TNC, TT and IT networks
- Un (L-N/L-L): 48 V, 60 V, 120/208 V, 230/400 V, 277/480 V, 400/690 V and higher
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors
- UL 1449 4th Ed. certified models

Type 2 SPD with grounding status monitoring

SAFEGROUND®

SAFEGROUND® is the first range of Type 2/Class II devices intended for protecting against induced voltage surges (8/20 µs) according to IEC/EN 61643-11, which incorporate a special LED for indication of proper installation and monitoring of the earth loop, so providing information on the effectiveness of the protection offered.

SAFEGROUND® is Cirprotec's premium solution, especially suitable for the most demanding installations, which by their nature require continuous monitoring of the state of the grounding system. Installation should be as close possible to the equipment to be protected to allow for a complete loop impedance measurement.

RATINGS AND FEATURES

- Patented SAFEGROUND® technology for loop impedance monitoring
- Checking of correct device wiring at installation time
- Continuous indication of the effectiveness of the protection offered
- Additional safety information in the event of indirect contacts
- Maximum discharge current (8/20 µs): 40 kA per phase
- Nominal discharge current (8/20 µs): 20 kA per phase
- TT and TNS networks
- Un (L-N/L-L): 230/400 V
- Plug-in DIN rail format
- Further information on page 60 of this catalogue or at www.cirprotec.com/safeground

Type 2+3 SPDs

PSM 20

PSM 20 is the range of Type 2+3/Class II+III devices intended for protecting against induced voltage surges (8/20 µs), in accordance with the IEC/EN 61643-11 standard.

Suitable for the second and final steps of protection in panels with Type 2 protection devices installed upstream, such as PSM 40. These systems should be installed as close as possible to the equipment to be protected.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 20 kA per phase
- Nominal discharge current (8/20 µs): 10 kA per phase
- Combined voltage pulse Uoc (1.2/50 µs): 10 kV
- TNS, TNC, TT and IT networks
- Un (L-N/L-L): 120/208 V, 230/400 V, 277/480 V and 400/690 V
- Models compatible with PLC Power Line Communications
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors

Type 3 SPDs

PSL

PSL is the range of Type 3/Class III devices which provide very fine protection (1,2/50 µs) from induced voltage surges to sensitive equipment, in accordance with the IEC/EN 61643-11 standard

Suitable for the final step of protection in panels with Type 2 protection devices installed upstream as a second step, such as PSM 40 or PSM 20. These systems should be installed as close as possible to the equipment to be protected.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 8 kA per phase
- Nominal discharge current (8/20 µs): 3 kA per phase
- Combined voltage pulse Uoc (1.2/50 µs): 6 kV
- TT and TNS networks
- Plug-in DIN rail format
- Visual and remote end of life indication
- Reversible chassis to allow cable entry from above or below
- Mechanically coded cartridges to avoid replacement errors

Type 2+3 SPDs

DM2

DM2 is the range of combined Type 2+3/Class II+III devices intended for protecting against induced voltage surges (8/20 µs) while providing a very fine protection (1,2/50 µs) to sensitive equipment, in accordance with the IEC/EN 61643-11 standard. Supplied with built-in high attenuation EMI filter.

Suitable for the final step of protection in installations with electromagnetic disturbances which could interrupt, degrade or limit system performance.

Series connection for applications up to 20 A rated current.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 20 kA
- Nominal discharge current (8/20 µs): 10 kA
- Combined voltage pulse (1.2/50 µs): 6 kV
- Attenuation filter up to 82 dB (common mode)
- Nominal phase current (IL): 20 A
- Single phase TT and TNS networks
- Un: 120 V, 230 V
- Monobloc DIN rail format
- Visual (LED) and remote (IR) end-of-life indicators
- External power indicator (LED)

Type 2+3 SPDs

CSF

CSF is the range of combined Type 2+3/Class II+III devices intended for protecting against induced voltage surges (8/20 µs) while providing a very fine protection (1.2/50 µs) to sensitive equipment, in accordance with the IEC/EN 61643-11 standard.

Suitable for the second and final steps of protection in panels with Type 2 protection devices installed upstream, such as PSM 40.

These systems should be installed as close as possible to the equipment to be protected. Ideal for small spaces. Wide range of rated voltages.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 20 kA, 6 kA
- Nominal discharge current (8/20 µs): 10 kA, 3 kA
- Combined voltage pulse (1.2/50 µs): 10 kV, 6 kV
- Single phase TT and TNS networks
- Un: 12 V, 24 V, 48 V, 60 V, 120 V, 230 V
- Also applicable to DC installations
- Monobloc DIN rail format
- Visual (LED) and remote (IR) end-of-life indicators
- External power indicator (LED)
- Space-saving "slim" format
- UL 1449 4th Ed. certified models

LED lighting SPDs Type 2+3

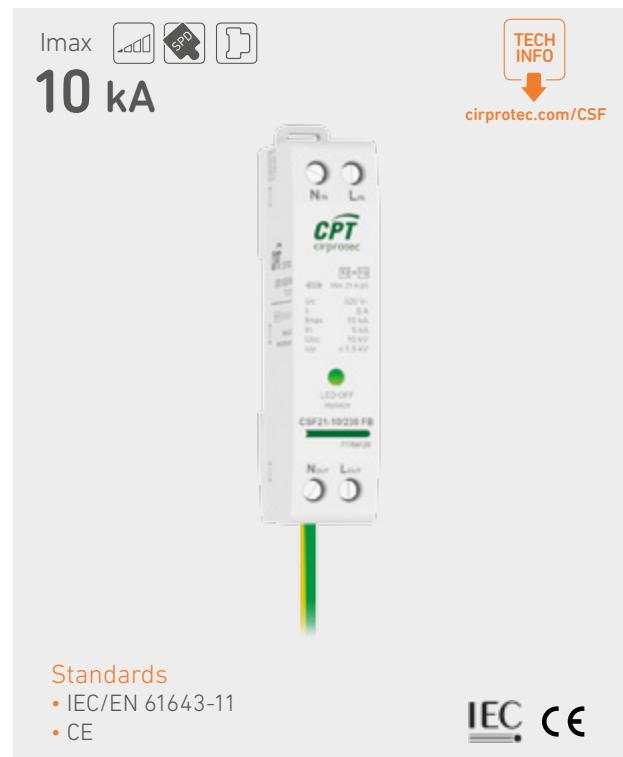

CSF FB

CSF FB is the range of combined Type 2+3/Class II+III devices intended for protecting against induced voltage surges (8/20 µs) while providing a very fine protection (1,2/50 µs) to sensitive equipment, in accordance with the IEC/EN 61643-11 standard.

Suitable for the protection of outdoor LED luminaires (street lighting), due to exposure of the LED electronics which are extremely sensitive to surges induced by lightning. This range has been designed to be installed in the pole within the fuse box, where there are DIN rails.

RATINGS AND FEATURES

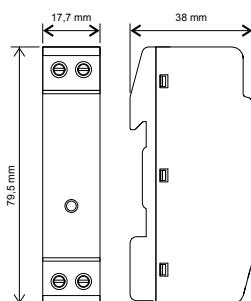

- Combined voltage pulse (1.2/50 µs): 10 kV (Uoc)
- Maximum discharge current (8/20 µs): 10 kA
- Nominal discharge current (8/20 µs): 5 kA
- Installation in series or parallel
- Compact size and easy to install
- Dual end-of-life indication: disconnection (wired in series) and local (status LED)
- No leakage current
- Nominal phase current (I_L): 2,5 A (series)
- For fuse boxes with DIN rail (in the lamp pole)

LED lighting SPDs Type 2+3

NS 10

The **NS 10** series consists of 2 ranges: NSS 10 and NSB 10. Both are combined Type 2+3/Class II+III devices of 10 kA (8/20 µs) and 10 kV (1,2/50 µs) intended for protecting outdoor LED luminaires from induced voltage surges, in accordance with IEC/EN 61643-11.

Suitable for protection of outdoor LED luminaires (street-lighting). Due to the exposure of LED electronics, which are extremely sensitive to surges induced by lightning, NSS-10/230 and NSB-10/230 are market standard solutions for manufacturers of LED lighting systems. See the features before choosing between NSS and NSB.

RATINGS AND FEATURES

- Combined voltage pulse (1.2/50 µs): 10 kV (Uoc)
- Maximum discharge current (8/20 µs): 10 kA
- Nominal discharge current (8/20 µs): 5 kA
- Rated load current (IL): 2,5 A (series)
- Class 1 and Class 2 luminaires
- Wired in series and parallel
- Dual end-of-life indication: disconnection (wired in series) and local (status LED)
- No leakage current
- NSS: miniature size, "universal" models
- NSB: compact size, IP66 models
- Optional: luminaire with overvoltage protection (NSS-10 or NSB-10) tested and certified by accredited laboratory

PART NUMBERS

ORDERING CODE	PART NUMBER	Network		Luminaires Class	Un [V]	Uc [V]	Imax (8/20) [kA]	In (8/20) [kA]	Uoc [kV]	Up@In [kV]	IL [A]	IP

LED lighting SPDs Type 2+3

NS 20

NS 20 is a combined Type 2+3/Class II+III device of 20 kA (8/20 µs) and 20 kV (1,2/50 µs) intended for protecting outdoor LED luminaires from induced voltage surges, in accordance with IEC/EN 61643-11.

Suitable for protection of special LED luminaire applications in sports stadiums, parks, green areas and other facilities where the voltage and discharge capacity needed are 20 kV and 20 kA, or rather, reinforced values.

RATINGS AND FEATURES

- Combined voltage pulse (1.2/50 µs): 20 kV (Uoc)
- Maximum discharge current (8/20 µs): 20 kA
- Nominal discharge current (8/20 µs): 10 kA
- Rated load current (I_L): 2,5 A (series)
- Rated voltage: up to 230 V
- Luminaires Class 1 and 2
- Wired in series and parallel
- Double end-of-life indication: disconnection (connected in series) and local (status LED)
- No leakage current
- Optional: luminaire with overvoltage protection (NS-20) tested and certified by accredited laboratory

COMPACT SOLUTION

Total protection in just 3 modules*
(surge, power frequency overvoltage
and MCB)

*Single phase version

AUTOMATIC RECLOSURE

Equipment with reconnection is suitable for installations that require continuity of service (remote or with little maintenance) or second homes.

EN 50550, CERTIFIED SAFETY

The entire Cirprotec power frequency overvoltage protection device range meets the EN 50550 standard "Power frequency overvoltage protective devices, POP".

QUICK AND EASY INSTALLATION (PREWIRED)

The internal prewiring system reduces installation time by over 50% compared to versions not prewired.

SOLUTION FOR INDUSTRY AND THE COMMERCIAL SECTOR

Cirprotec has a range of specific solutions for industrial and commercial sector applications, which act on undervoltage release, shunt release or contactor.

COMBINED (POP+SPD) AND TESTABLE PROTECTORS

Cirprotec has a wide range of combined protection devices against power frequency overvoltages and surges.

They incorporate a POP test button (checking that the device is working properly).

V-CHECK 4R

V-CHECK 4R is the range of combined surge and power frequency overvoltage protection devices (SPD+POP), which act on a release or contactor (MCCB). Type 2/Class II 40 kA (8/20 µs) for 230 V, 3-phase (3Ph+N).

Suitable for industrial installations, on-site panels (V-CHECK 4R), commercial facilities (4RPT) and as a first protection step in street lighting panels (V-CHECK 4RC).

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 40 kA per phase
- Nominal discharge current (8/20 µs): 15 kA per phase
- Un (L-N/L-L): 230/400 V
- Visual and remote end of life indication of SPD
- Monobloc DIN rail format, 4 modules (3Ph+N)
- POP test button
- Acting on shunt release, undervoltage release or contactor

V-CHECK MPT MINI

V-CHECK MPT mini is the range of compact, prewired, combined surge and power frequency overvoltage protection devices (SPD+POP), complete with MCB, Type 2/Class II 15 kA (8/20 µs) for 230 V, single phase (1Ph+N) and 3-phase (3Ph+N) models.

Compact solution, ideal for interior residential protection panels and common service panels with limited space (suitable for retrofitting). Quick and easy installation.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 15 kA per phase
- Nominal discharge current (8/20 µs): 5 kA per phase
- Un (L-N/L-L): 230/400 V
- Monobloc DIN rail format, 3 modules (single phase) and 7 modules (3-phase)
- POP test button
- Models from 6 A to 63 A. Rated current of the MCB suitable for each installation rating
- Breaking capacity of the MCB: 6 kA.
- Prewired and compact

POP prewired devices

V-CHECK MP

V-CHECK MP is the range of power frequency overvoltage protection devices (POP), complete with MCB, 230V, single phase (1Ph+N) and 3-phase (3Ph+N) models.

Equipment prewired for fast, safe installation. It is recommended to complement this with Type 2 surge protection (see PSM range).

RATINGS AND FEATURES

- Un (L-N/L-L): 230/400 V
- Monobloc DIN rail format, 3 modules (single phase) and 7 modules (3-phase)
- Models from 6 A to 63 A. Rated current of the MCB suitable for each installation rating
- Breaking capacity of the MCB: 6 kA
- Prewired

SLIM

Suitable for very restricted spaces.
Suitable for protecting several
analogue/digital inputs by placing
multiple protectors in parallel.

EASY TO INSTALL

Products designed for installation on
DIN rail or free-standing or in-line,
and with cable terminals or the
corresponding connectors
depending on the characteristics of
the application.

VERY FINE PROTECTION

Extremely low residual voltage
values for effective protection of
particularly sensitive electronic
equipment.

END-OF-LIFE INDICATION

Installation in series for protector
end-of-life indication through line
disconnection.

WIDE VARIETY OF PROTOCOLS AND APPLICATIONS

Wide range of solutions for different
communications protocols: ADSL,
Ethernet CAT6 (PoE), KNX, 4-20 mA,
RS232, RS485, CCTV, etc.

Data network (Ethernet)

NETPRO

NETPRO is the range of surge protection devices for equipment connected to data networks. Depending on the structure of the network in which they are used, they are classified by Ethernet categories into Cat. 5E, Cat. 6 and Cat. 6 and with Power over Ethernet (using two pairs for communications and two for power supply). Available in versions for 18 or 24 position rack mounting.

These are protectors for a final step of very fine protection to be installed as close as possible to particularly sensitive equipment connected to these communications lines. Meets the IEC 61643-21 standard.

RATINGS AND FEATURES

- Rated discharge current C1 (8/20 µs): 250 A
- Uc: 6 V (55 V PoE)
- Bandwidth of 100 MHz Cat. 5E, 250 MHz Cat. 6
- RJ45 format and in multiple RJ45 rack
- Installation in series with the communications line
- End-of-life indication by communications line interruption
- Rated 100 mA line current (1A PoE)

Measurement and control

DIN | BNV | DB

DIN | BNV | DB are three ranges of surge protection devices for equipment connected to measurement and control networks. They cover a wide variety of applications in communications signals, such as RS232, RS485, 4-20 mA, Binary, KNX, PTC or Modbus. The ranges offer a number of formats, voltages and numbers of lines protected and are designed especially for such applications.

These are protectors for a final step of very fine protection to be installed as close as possible to particularly sensitive equipment connected to these communications lines. Meets the IEC 61643-21 standard.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 0,5 to 10 kA
- Rated discharge current C2 (8/20 µs): 0,5 to 5 kA
- Uc: 7 V to 180 V
- Bandwidth from 0,5 to 12 MHz
- Formats: DIN rail, free-standing DB9-25, terminal block
- Installation in series with the communications line
- End-of-life indication by communications line interruption
- Rated line current 0,1 to 0,5 A

Telephone lines

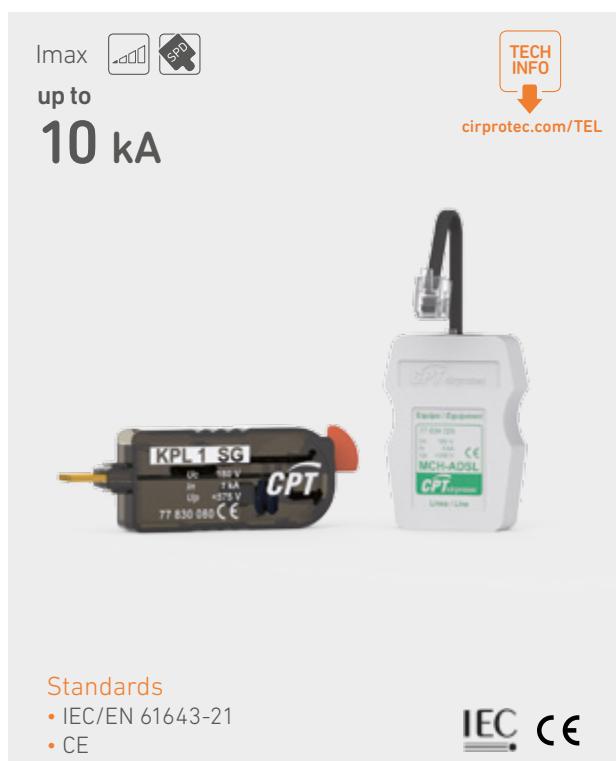

DIN | MCH | KPL

DIN | MCH | KPL are three ranges of surge protection devices for equipment connected to telephone lines. They are classified by format, depending on the application, into free-standing (in-line) on RJ12 cable, DIN rail, and Krone power strips. There are protectors for different protocols – ADSL, ISDN or PP – in turn within these categories.

These are protectors for a final step of very fine protection to be installed as close as possible to particularly sensitive equipment connected to these communications lines. Meets the IEC 61643-21 standard.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 2,4 to 10 kA
- Rated discharge current C2 (8/20 µs): 1 to 5 kA
- Uc: 7 V (PP), 18/56 V (ISDN), 180 V (ADSL)
- Bandwidth up to 3 MHz
- Formats: DIN rail, free-standing (in-line) RJ12, Krone
- Installation in series with the communications line
- End-of-life indication by communications line interruption
- Rated 100 mA line current

Radio frequency (Coaxial)

CT

The **CT** range of RF surge protection devices is used to protect equipment connected to coaxial cable lines. There are several different compatible products, depending on the type of cable and connector.

These are protectors for a final step of very fine protection to be installed as close as possible to particularly sensitive equipment connected to these communications lines. Meets the IEC 61643-21 standard.

RATINGS AND FEATURES

- Maximum discharge current (8/20 µs): 2 to 20 kA
- Rated discharge current C2 (8/20 µs): 1,5 to 10 kA
- Uc: 24 V to 230 V
- Bandwidth up to 3 MHz
- Suitable for BNC, TNC, N, F, TV and UHF connectors
- Installation in series with the communications line
- End-of-life indication by communications line interruption
- Permissible power of 100 to 150 W

Imax **20 kA**

MONITORING THE GROUNDING SYSTEM FROM WITHIN THE SURGE PROTECTION DEVICE ITSELF

The only surge protection device on the market that tells you when it is properly installed, avoiding risks due to electrical wiring errors and/or poor ground connection.

24X7

Provides maximum continuity of service, making it ideal for 24x7 facilities at remote locations. Continuous network monitoring and control.

GROUNDING SYSTEM MONITORING

Devices for monitoring facility ground connection status.

Monitoring

Ground monitor inside protector (SPD)

SAFEGROUND®

For the protection to work properly, the correct status of the grounding system in an electrical installation is essential.

DID YOU KNOW that nobody knows what percentage of installed surge protection devices provide really good protection?

SAFEGROUND® is the first protection device on the market that, in addition to indicating that it is properly wired, guarantees that there is an adequate path to ground, which is essential if the protection device is to shunt the energy peaks to ground effectively.

THE PREMIUM SOLUTION FOR THE MOST DEMANDING INSTALLATIONS

SAFEGROUND®'s simple information makes it the ideal ally for both unskilled personnel and maintenance professionals specialised in ground connections.

Helps avoid situations that might cause power cuts, repair costs, with the resultant damage to your brand image.

Provides additional information about the grounding system, with potential synergies for protection and safety in general, not just for surge protection.

GROUND STATUS INDICATOR

Continuous LED display of ground status.

NO CONNECTION 

POOR 

CORRECT 

THE BEST SPD ON THE MARKET

SAFEGROUND® is the premium protection device in the Cirprotec PSM range, designed according to the most exacting standards. Intelligent protection.

SAFE GROUND® TECHNOLOGY

SAFEGROUND® is based on the impedance loop technology already patented, sold and implemented by Cirprotec in thousands of protection solutions. SAFEGROUND® patent pending.

WIRING SAFETY

The only protection device on the market that tells you when it is properly installed, avoiding risks due to electrical wiring errors.

SAFEGROUND®

MONITORING THE GROUNDING SYSTEM IN THE SURGE PROTECTION DEVICE ITSELF

CONFIRMATION OF PROPER INSTALLATION

Almost 25 years of experience in the sector confirm that it is relatively common for wiring errors to occur during the installation of surge protection devices. These errors result in the loss of protection or risks to the installation itself.

When the SAFEGROUND® LED is green, it means that the protection device is properly wired and powered up. Green for Go.

EFFECTIVE SURGE PROTECTION

Even when equipped with surge protection devices, the electrical installation may still be subject to the effects of overvoltage if the ground connection is inadequate or in poor condition.

When the SAFEGROUND® LED is green, it indicates that the ground path is good enough to shunt the energy peaks to ground effectively. Green for Go.

SAFETY INFORMATION IN THE EVENT OF INDIRECT CONTACT

Just as happens with surge protection devices, the safety of the electrical installation in the event of indirect contact is based on there being a grounding connection.

When SAFEGROUND® cannot detect any ground connection, it is advisable to check the installation status.

RATINGS AND FEATURES

- Patented SAFEGROUND® technology for loop impedance monitoring
- Checking of correct device wiring at installation time
- Continuous indication of the effectiveness of the protection offered
- Additional safety information in the event of indirect contacts
- Maximum discharge current (8/20 µs): 40 kA per phase
- Nominal discharge current (8/20 µs): 20 kA per phase
- TT and TNS networks
- Un (L-N/L-L): 230/400 V
- Plug-in DIN rail format
- Further information on page 29 of this catalogue or at www.cirprotec.com/safeground

Continuous grounding system monitor

G-CHECK®

G-CHECK® is a control device that continuously monitors the state of the ground connection:

- Ensures proper operation of surge protection devices (SPDs) that discharge energy through the facility ground connection.
- Provides additional safety information to avoid indirect contacts.
- Reduces preventive maintenance costs.

By the loop resistance calculation method, G-CHECK checks the impedance of the actual leakage path of an indirect contact, enabling it to **detect the following possible incidents**, both in the installation itself and in transformer centre to which it is connected:

- Deterioration of the ground connection** due to ageing of the earth rods, due to theft or increased soil resistivity during dry periods.
- Breakage or incorrect wiring of the neutral cable.**

RATINGS AND FEATURES

- The system of grounding measurement by loop impedance can be applied to the various neutral configurations: TT, TNS and TNC-S
- Un (L-N/L-L): 120/208 V, 230/400 V
- Monobloc DIN rail format
- Alarm function on the ground value (PE). Activates the output if it detects a value shown on the display exceeding a maximum preset by the user
- Consult [www.cirprotec.com/g-check](http://cirprotec.com/g-check)

Grounding system monitoring

EASY TO INSTALL

Panel mounting

HELPS MAINTENANCE

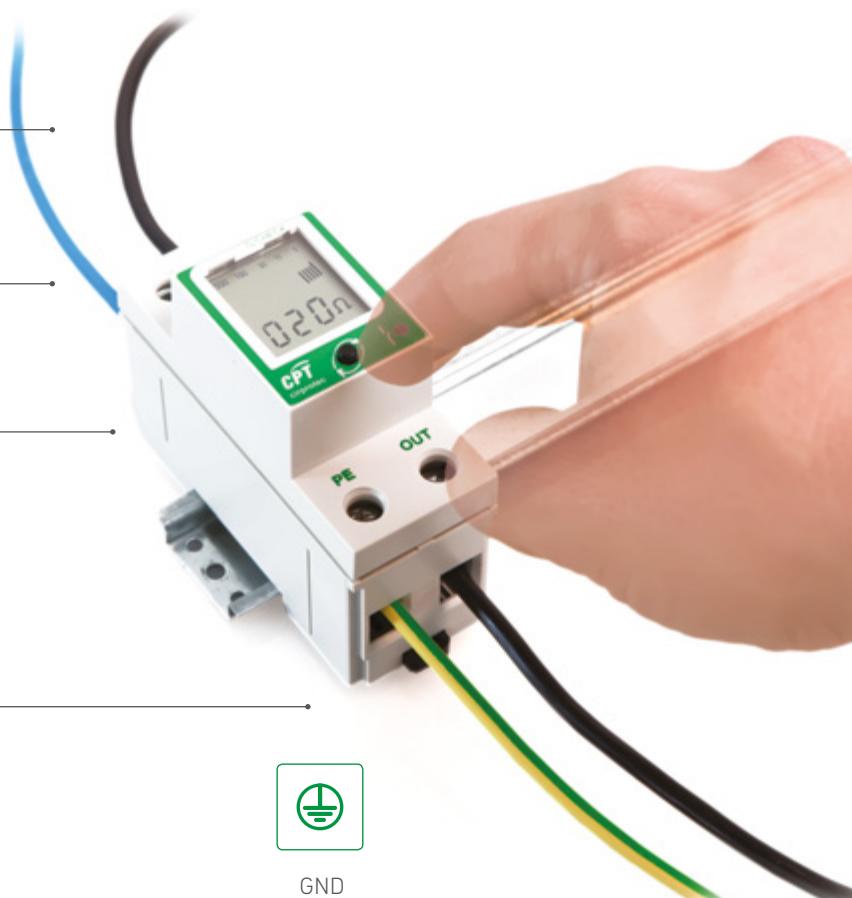

Complementary to regular grounding system maintenance

Real-time monitoring of grounding system condition

MONITORS

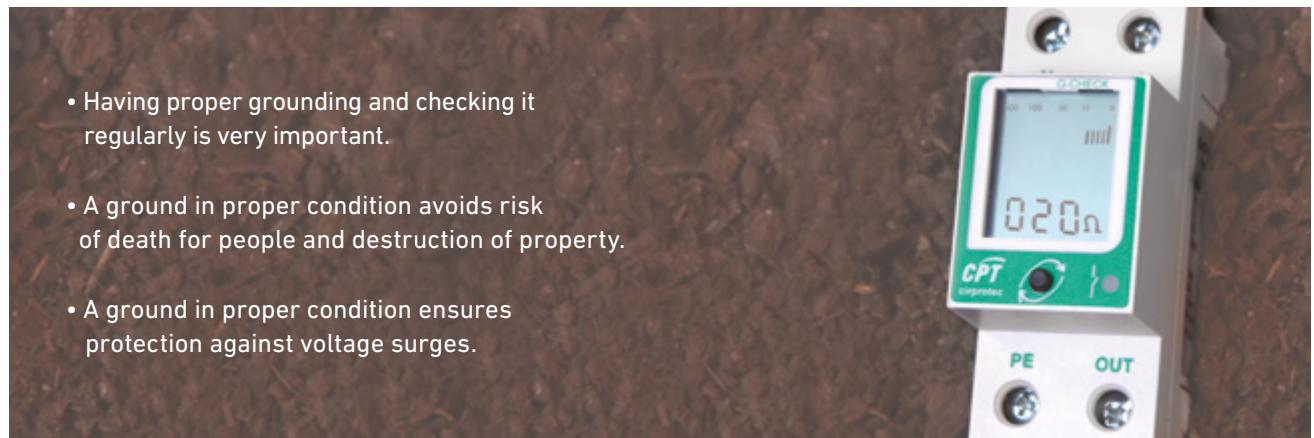

Cable theft / Soil resistivity

Cable breakage / poor connection

GND

IMPORTANCE OF GROUNDING SYSTEMS

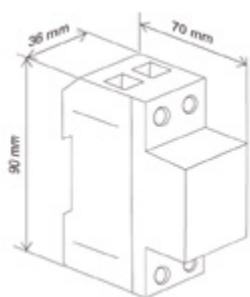

- Having proper grounding and checking it regularly is very important.
- A ground in proper condition avoids risk of death for people and destruction of property.
- A ground in proper condition ensures protection against voltage surges.

PART NUMBERS

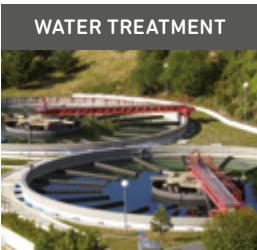

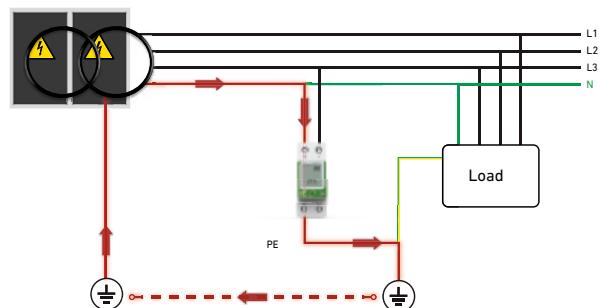

ORDERING CODE	PART NUMBER	Un [V]	Frequency [Hz]	Setting threshold	Output relay	Response time
77706550	G-CHECK 120V	120	50 / 60	1...500 Ω	1(OUT-N)	inst.
77706500	G-CHECK 230V	230	50 / 60	1...500 Ω	1(OUT-N)	inst.

DIMENSIONS

MEASUREMENT LOOP

Measurement loop or leakage current loop in TT systems.

Insulation monitor

ISO-CHECK

Isolated power supply networks guarantee maximum service continuity, because they are isolated from ground, an earth defect does not generate a dangerous current and so it can continue to work under these conditions. However, an earth fault is a situation to have under control and to rectify quickly to avoid major safety problems. This is performed using an insulation monitoring device.

ISO-CHECK is a device that continually checks the insulation resistance value between live conductors and ground for different applications:

- In alternating current for IT systems
- In the direct current part of fast chargers for electric vehicle (CHAdeMO protocol)
- In the direct current part of photovoltaic facilities in which both poles (positive and negative) are isolated from earth.

The insulation monitoring device is connected between any of the live conductors and earth by superimposing a measurement voltage between them. If an insulation defect occurs, the circuit is closed and a resistance measured, comparing this with the threshold set in the equipment.

RATINGS AND FEATURES

- There are solutions that are especially dedicated to certain applications: AC (IT), DC (Photovoltaic), DC (Electric vehicle)
- Un (L-N): 120V, 230V
- Activation threshold adjustable from 5 to 300 kΩ
- Alarm relay with volt-free contact
- Operation and alarm signalling LED
- Remote activation signal
- TEST buttons for fault simulation and remote signalling
- Consult: www.cirprotec.com/isocheck

cirprotec.com/ISOCHECK

24x7

Continuous insulation monitoring

ADJUSTABLE RESISTANCE THRESHOLD

Manually adjustable activation value

VISUAL AND REMOTE SIGNALLING

With remote signal and volt-free contact and operation and alarm LEDs

SPECIFIC SOLUTIONS FOR EVERY APPLICATION

- IT (AC)
- Photovoltaic (DC)
- Electric vehicle (DC)

ISO-CHECK

FOR IT INSTALLATIONS (AC)

ORDERING CODE	PART NUMBER	Nominal internal voltage	Auxiliary power supply voltage	Adjustment threshold	Output relay	Relay response
77706701	ISO-CHECK 120V	120-230 V AC	120-230 V AC	50...300 KΩ	1	inst.
77706700	ISO-CHECK 230V	230-380 V AC	230-380 V AC	50...300 KΩ	1	inst.

FOR PHOTOVOLTAIC INSTALLATIONS (DC)

ORDERING CODE	PART NUMBER	Nominal internal voltage	Auxiliary power supply voltage	Adjustment threshold	Output relay	Relay response time 1	Relay response time 2
77706703	ISO-CHECK PV 1000	500-1000 V DC	230 V AC	30...80 KΩ	2	inst.	1...10 s
77706704	ISO-CHECK PV 600	300-600 V DC	230 V AC	30...80 KΩ	2	inst.	1...10 s

FOR ELECTRIC VEHICLE CHARGING FACILITIES (DC)

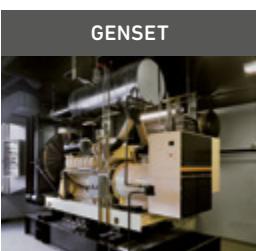

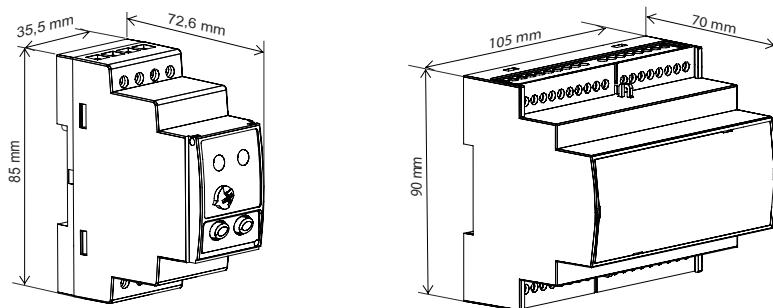

ORDERING CODE	PART NUMBER	Nominal internal voltage	Auxiliary power supply voltage	Adjustment threshold	Output relay	Relay response time 1	Relay response time 2
77706710	ISO-CHECK EV 500	50-500 V DC	230 V AC	40...80 KΩ	2	inst.	1...10 s
